Requirement: Python 3.10 or later

Some Python modules such as : sklearn, tensorflow numpy,scipy need to download before you run the code. Download command : pip install <The module>

If you can run the Lab experiment code of the course, you just need to download the tensorflow module ,then you can run my upload code.

The dependencies is "datasets", which contains the 4 systems and all the configuration options data. You need to make sure the "datasets" is in the same directory with the Python code file.
